Daily Frontend and Backend Testing Guide

This guide defines practical checks that can be performed every day. Manual testing confirms the user experience and unexpected behavior, while automation provides fast, repeatable coverage for stable workflows and APIs.

Frontend testing

Manual daily checks	Automated daily checks
• Verify login, navigation, forms, search, filters, uploads and core user journeys. • Check layout, text, buttons, error messages and responsiveness on supported screen sizes. • Test browser compatibility, keyboard access, focus order and basic accessibility. • Inspect slow loading, broken links, console errors and incorrect API data shown in the interface.	• Run smoke tests for critical journeys after every deployment. • Run UI regression tests for stable screens, validations and role-based access. • Execute cross-browser tests and selected visual comparison checks. • Track page-load timing, failed network calls, JavaScript errors and flaky tests.

Backend testing

Manual daily checks	Automated daily checks
• Send valid, invalid, missing and boundary-value requests to important APIs. • Verify status codes, response fields, business rules, authentication and permissions. • Check database changes, duplicate requests, error handling and audit records where access is available. • Review logs for exceptions, timeouts, failed jobs and incorrect device or user mapping.	• Run API smoke and regression suites for critical endpoints. • Validate response schemas, required fields, data types and contract compatibility. • Run controlled load checks for response time, throughput, errors and recovery. • Monitor service health, queues, database connections and scheduled-job failures.

Recommended daily execution

Start of day	After a build	During the day	End of day
Review deployments, open defects and environment health.	Run automated smoke tests, then manually verify critical flows.	Retest fixes and investigate failures with logs and request references.	Publish pass, fail and blocked results with evidence and owners.

Daily evidence to keep Build and environment, test date, test data, pass or fail status, screenshots or logs, defect ID, severity, owner and retest result.
